Revised 24/09/2020

## DESCRIPTION

The Actiwatch is a compact battery operated activity monitor that looks like a wrist watch.

It is generally used to measure patterns of the sleep/wake cycle. Through the use of an accelerometer, motion is measured and the activity is stored within the device.

The Actiwatch comes with its own software for data processing and display. The data produces a graphical display which plots periods of rest and activity.

## APPLICATIONS

For people living with dementia who experience difficulty in sleeping.

They may sleep during the day and are awake and restless at night. Some are no longer able to tell the difference between night and day.

The Actiwatch is used by clinicians to help diagnose, measure and monitor individuals experiencing sleep disorders.
