

DESCRIPTION

Many people with dementia like to continue to take a walk, to go to the shops or to exercise a pet. Due to the impact of cognitive impairment, the person may become disorientated to the place they are in, forget the route back to their desired location or decide to head to a location other than was first intended. For many people with dementia, the freedom, autonomy and choice of taking a walk is an important right that maintains their emotional well-being.

If the person usually takes their mobile phone with them, phone-locating apps can make it easier to locate them, should they become lost.

If your lost phone is a smartphone, all three of the major platform providers (Apple, Google, and Microsoft) include phone retrieval technology in their devices. Usually, the way these apps work is through the account associated with your device.
